Key Takeaways

Cold aisle cabinets are designed to optimize airflow and cooling efficiency, with aisle widths typically ranging from 1. 2 meters to 1. 8 meters and cabinet heights and widths standardized for modular containment systems.

Aisle Dimensions and Layout

Aisle Width: Standard cold aisle widths are minimum 1. 2 meters (approximately 4 feet) to allow two full floor tiles between cabinet fronts for optimal airflow. Wider aisles may be required for ceiling heights above 3.

7 meters to accommodate overhead systems like lighting and fire suppression. Aisle Length: Continuous rows of cabinets should not exceed 16 meters. If one end of the aisle is closed or lacks a personnel exit, the maximum length is limited to 6 meters for safe access and evacuation.

Cabinet Spacing: Cold aisle containment systems require uniform cabinet heights and continuous rows to ensure proper sealing and airflow management.

Height and Width: Typical cabinets compatible with cold aisle containment systems include 600mm, 700mm, and 800mm widths and heights around 1950mm. Heat Load Capacity: Modern cold aisle containment systems can handle up to 20kW per cabinet, supporting high-density server deployments, compared to conventional raised floor cooling systems that manage 7–8kW per cabinet. Door and Panel Options: Containment systems may feature sliding or swinging doors, often with Lexan (polycarbonate) windows for visibility and safety.

Panels are modular and removable for maintenance.

Containment System Features

Airflow Management: Cold aisle containment isolates the cold air supply from hot exhaust air, ensuring uniform, predictable temperatures at server inlets and reducing hotspots. Energy Efficiency: By directing cold air precisely to equipment intakes, containment systems improve cooling efficiency and reduce energy consumption. Modularity and Scalability: Systems are designed to adapt to various data center layouts, supporting aisle widths from 36 inches to 96 inches and allowing easy reconfiguration as demands evolve.

Passive vs Active Systems: Passive systems rely on existing cooling and server fans, while active systems may integrate additional airflow management components.

Summary

Cold aisle cabinets and containment systems are critical for efficient data center cooling, equipment reliability, and energy savings. Key parameters include aisle width (1. 2–1.

8 meters), cabinet dimensions (typically 600–800mm wide, 1950mm high), heat load capacity (up to 20kW per cabinet), and modular containment features such as sliding doors and removable panels. Proper design ensures uniform airflow, reduced hotspots, and scalable deployment for high-density server environments.
