Fiber optic cables and pigtails are different

Overview

Fiber Optic Pigtails: Uses & Differences from Patch CordsIn this guide, we will break down what fiber optic pigtails are, how they differ from patch cords.

Key Takeaways

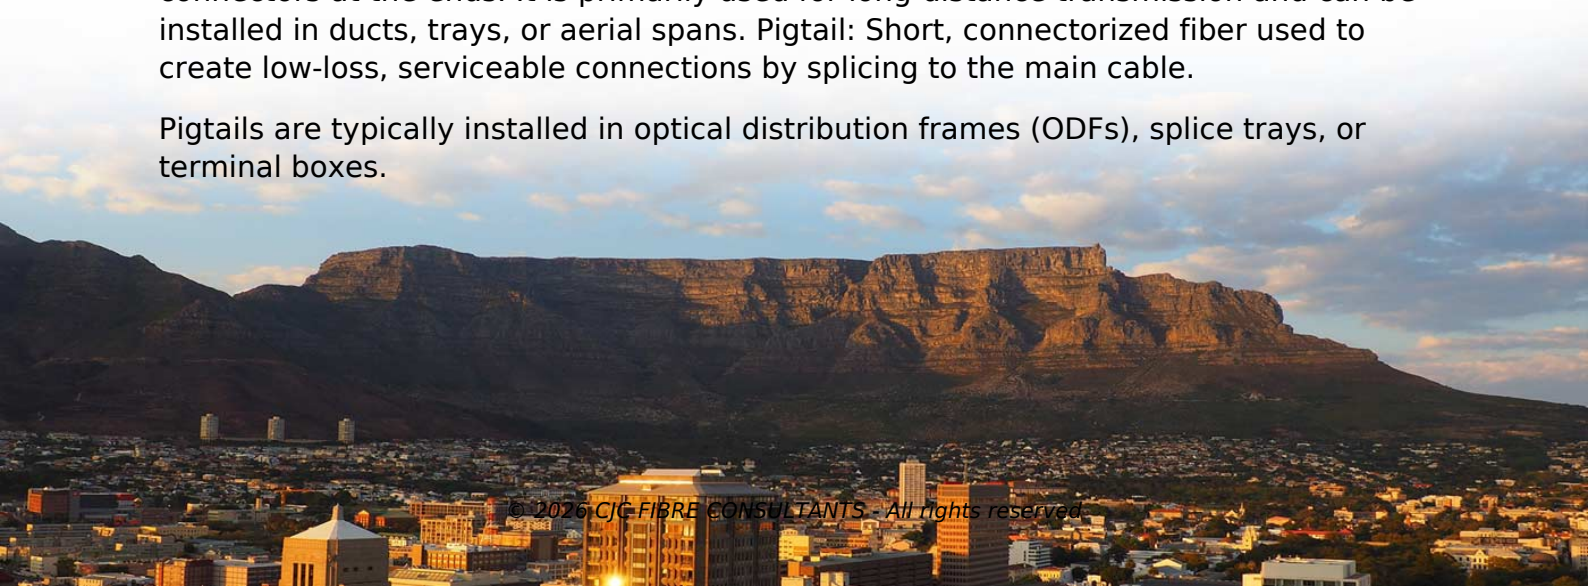

The presence of fiber optic cables does not necessarily mean that pigtails are present. Fiber optic cables are the primary medium for transmitting optical signals and can exist independently in a network as bare fibers or within protective jackets for indoor, outdoor, or direct-burial applications. Pigtails, on the other hand, are short lengths of fiber with a factory-terminated connector on one end and a bare fiber on the other, designed specifically to be spliced to the main cable at distribution points.

They serve as interfaces between bulk fiber cables and active equipment or patch panels.

Key Differences

Fiber Optic Cable: Can be simplex, duplex, or multi-core, and may or may not have connectors at the ends. It is primarily used for long-distance transmission and can be installed in ducts, trays, or aerial spans. Pigtail: Short, connectorized fiber used to create low-loss, serviceable connections by splicing to the main cable.

Pigtails are typically installed in optical distribution frames (ODFs), splice trays, or terminal boxes.

Practical Implications

Not all fiber optic installations require pigtails. For example, pre-terminated cables with connectors on both ends (patch cords or factory-terminated cables) can connect directly to equipment without splicing. Pigtails are mainly used when field splicing is necessary, such as in multi-core trunk cables or when creating organized connections in high-density panels.

Therefore, a network may have fiber optic cables without any pigtails if factory-terminated solutions or direct connectorized cables are used. In summary, fiber optic cables can exist without pigtails, and pigtails are only introduced when splicing or creating a connectorized interface is required for network flexibility, low-loss connections, or maintenance purposes.
