Overview

A Flip-type KV

M (Keyboard, Video, Mouse) switch is designed to let a user control two computers from a single set of peripherals. Unlike standard KVM switches, the "Flip" functionality emphasizes quick toggling between systems, often via a physical button or remote control, making it ideal for environments where frequent switching is required, such as offices, home setups, or secure government networks.

Key Features

Secure Switching: Certain models, like the Belkin Secure Flip 2-Port KVM, are certified for isolated network environments, ensuring that data paths between systems remain physically separated, which is critical for government, defense, and finance applications. Peripheral Support: Flip KVM switches handle keyboard, mouse, video, and audio signals, supporting USB and DisplayPort or DVI connections. Compatibility: They work across multiple operating systems, including Windows, Mac OS, and Linux.

Compact Design: These switches are typically desktop-sized, making them easy to integrate into existing setups without taking up much space.

Use Cases

Home Office or Multi-PC Setup: Easily switch between a work laptop and a personal desktop or gaming PC without unplugging peripherals. Secure Environments: Government or financial institutions can maintain network isolation while allowing a single user to access multiple secure systems. Legacy and Modern Systems: Flip KVMs can connect older and newer computers simultaneously, providing seamless access to files and applications across different platforms.
