High-altitude installation of optical cables

Overview

An outside plant cable installation may require several different types of cables depending on the method of installation and the route of the cable plant, e.g.

Key Takeaways

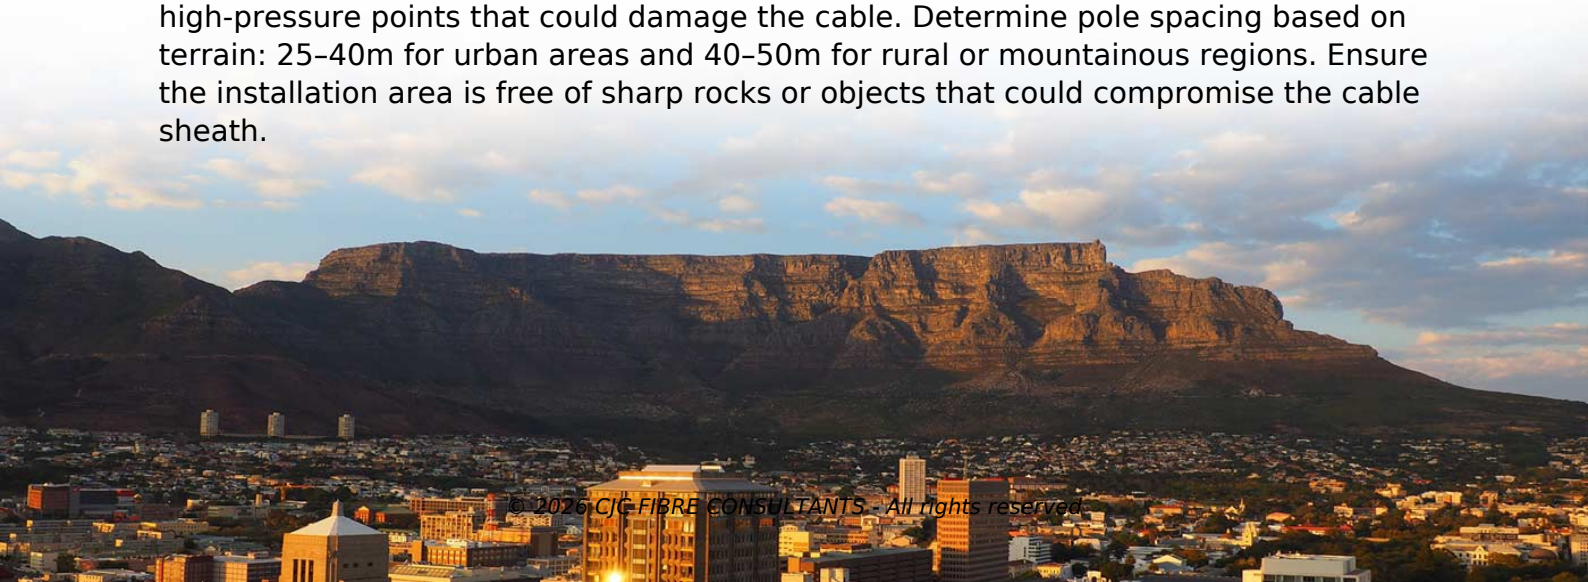

High-altitude optical cables should be installed using aerial deployment techniques with careful attention to tensile strength, bend radius, environmental protection, and proper handling to prevent fiber damage.

Cable Selection and Preparation

Choose aerial-rated fiber optic cables, such as self-supporting ADSS (All-Dielectric Self-Supporting) cables or messenger-supported cables, which are designed to withstand wind, ice, and temperature extremes from -40°C to +80°C. Ensure the cable has adequate tensile strength for the span length, typically 1,500N for short spans and up to 12,000N for long-distance ADSS cables. Keep protective materials on the cable until installation to prevent mechanical damage.

Route Assessment

Before installation, survey the route carefully to identify obstacles, sharp edges, or high-pressure points that could damage the cable. Determine pole spacing based on terrain: 25–40m for urban areas and 40–50m for rural or mountainous regions. Ensure the installation area is free of sharp rocks or objects that could compromise the cable sheath.

Installation Techniques

Aerial Deployment: Suspend the cable from poles or towers using messenger wires or self-supporting designs. Maintain a minimum bend radius of at least 20 times the cable diameter to prevent microbending loss. Avoid sharp turns, kinks, or twisting; use figure-8 loops when laying cable on the ground to prevent torsion.

Pulling and Tension Control: Use proper pulling techniques with aramid yarn strength members to avoid exceeding the cable's maximum tensile load. Monitor tension carefully, especially in high-altitude windy conditions, to prevent fiber breakage. Environmental Protection: Protect the cable from UV exposure, ice, and extreme temperatures during installation.

If the cable remains outdoors for more than 24 hours before final placement, use protective coverings. Splicing and TerminationHigh-altitude installations often require fusion splicing for long runs. Use factory-made pigtails for connectors and inspect all terminations with a microscope to ensure low loss and proper polishing.

Test each fiber end-to-end with an OTDR to document performance and detect any installation damage.

Safety Considerations

Use proper climbing and fall protection equipment when working at height. Avoid installing during high winds or icy conditions. Ensure all personnel are trained in aerial cable handling and high-altitude safety protocols.

Post-InstallationAfter installation, inspect the entire route for mechanical stress points, sag, and proper tension. Document all splices, terminations, and test results for future maintenance. Regular inspections are recommended to ensure long-term reliability in harsh high-altitude environments.

By following these guidelines, high-altitude optical cables can be installed safely and reliably, maintaining optimal performance and minimizing the risk of fiber damage.

ITU-T Rec. L.163 (11/2018) Criteria for optical fibre cable ...

This Recommendation also describes how to mitigate the considerable risks and/or issues to which the optical fibre cable may be exposed when infrastructures are minimal during installation, maintenance

Installation of Solo® ADSS All-Dielectric Self-Supporting Fiber Optic ...

This procedure provides general information for installing all Corning Optical Communications Solo® ADSS All-Dielectric Self-Supporting fiber optic cables from 2-288 fibers.

Harsh Environment Fiber Optic Cable Solutions for Extreme

Explore how to select the right fiber optic cable for challenging environments including high temperatures, extreme cold, salt spray, humidity, underground ducts, and direct burial.

ITU-T Rec. L.156 (03/2018) Air-assisted installation of optical fibre ...

Recommendation ITU-T L.156 describes air-assisted methods for installation of optical fibre cables in ducts. These methods can be used to install microcables into microducts, or larger cables into ducts

Aerial Fiber Optic Cable Installation Guide

The document discusses four methods for installing aerial optical fiber cables: figure 8 cables, lashed cables, ADSS cables, and OPGW cables. It provides details on the characteristics, installation

The FOA Reference For Fiber Optics -Outside Plant Construction

Deploying fiber above ground on poles or towers removes the need for underground digging and is particularly useful when the ground is uneven, rocky or both. Aerial installation is generally much less

Overhead Fiber Optic Cable Installation Requirements And 2 Cable

Overhead fiber optic cable is an optical cable installed on poles. One of the most advantage for the overhead fiber optic cable is that it can use the original overhead wire and pole

Air-Assisted Installation Considerations

Corning Optical Communications field trials have confirmed that a single air-assisted device can install 1500 to 2100 meters (5000 to 7000 feet) of optical fiber cable under good conditions. Longer lengths

Indoor and Outdoor Fiber Optic Cable Installation: Key Considerations ...

© 2026 CJC FIBRE CONSULTANTS - All rights reserved

Fiber optic installation is a critical step in building high-performance, reliable networks. Selecting the right fiber optic cable ensures efficient data transmission, longevity, and durability in
