

High-precision CWDM module for edge computing

Overview

Understanding CWDM Optical Modules: From Principles to Applications With the development of optical communication technology, CWDM is also constantly evolving.

Key Takeaways

High-precision CWDM modules, such as 100G QSFP28 CWDM4 transceivers, enable cost-effective, low-power, and reliable optical links for edge computing networks.

Overview of CWDM Technology

Coarse Wavelength Division Multiplexing (CWDM) allows multiple optical signals at different wavelengths to travel simultaneously over a single fiber, creating multiple “lanes” for data transmission.

CWD

M typically uses 20nm wavelength spacing across the 1270–1610nm spectrum, covering O, E, S, C, and L bands, and supports up to 18 channels, though 4- or 8-channel modules are common for edge deployments.

Unlike DWD

M, CWDM modules are simpler, uncooled, and consume significantly less power, making them ideal for short- to medium-range links in edge computing scenarios.

Key Features for Edge Computing

High Precision and Compatibility: Modules like the EdgeCore ET7402-CWDM4 support 100Gb/s Ethernet over single-mode fiber up to 2 km, using four CWDM channels at 1271, 1291, 1311, and 1331 nm, fully compliant with ITU-T G. 694.2 standards.

Low Power Consumption: CWDM modules typically consume around 0.5W per channel, compared to 4W for DWDM, reducing operational costs and supporting green initiatives.

Cost-

Effectiveness: CWDM modules are 30–50% less expensive than DWDM, with simpler maintenance and no need for precise wavelength locking or cooling.

Protocol Flexibility: CWDM supports Ethernet, Fibre Channel, ATM, POS, and SDH, making it suitable for diverse edge computing workloads.

Rapid Deployment: The plug-and-play nature of QSFP28 CWDM modules allows quick integration into existing fiber infrastructure, ideal for edge nodes and micro data centers.

Applications in Edge Computing

Edge Data Centers: CWDM modules interconnect servers and storage devices over short distances (up to 2 km), enabling high-speed data aggregation and low-latency processing.

5G Fronthaul and xHaul Networks: CWDM supports multi-service aggregation for 5G base stations, providing scalable bandwidth without the complexity of DWDM.

Enterprise and Metro Networks: CWDM modules expand backbone links and connect multiple edge sites efficiently, balancing cost, power, and performance.

Considerations

While CWD

While CWDM is highly suitable for edge computing, it is optimized for moderate distances and channel counts. For longer distances or higher channel density, DWDM or coherent tunable DWDM modules (e.g., QSFP28 100ZR) may be considered, though at higher cost and power consumption.

Conclusion High-precision CWDM modules, particularly 100G QSFP28 CWDM4 transceivers, provide a low-power, cost-effective, and flexible solution for edge computing networks.

They enable rapid deployment, support multiple protocols, and meet the bandwidth and latency requirements of modern edge applications, making them a practical choice for metro, enterprise, and 5G edge environments.
