How far can 100Mbps multimode optical fiber go

Overview

Fiber optic cable can be run anywhere from 300 meters up to 80 kilometers (roughly 50 miles) depending on the cable type, transceiver used, and network standard. The primary multimode fiber types are OM1, OM2, OM3, OM4, and OM5. Each type has specific characteristics that affect its maximum distance and performance, especially at higher data transmission rates. Exceed it and you get bit errors, dropped packets, or total signal loss — no warning lights, no graceful degradation. This guide covers the. Multimode fiber optic cables are designed to carry multiple light modes simultaneously, each taking a different path or mode through the fiber. This characteristic makes MMF ideal for high-bandwidth applications over relatively short distances.
