

How to modify fiber optic cable in CAD

Overview

I'm wanting to create documentation for a control fiber optic network. I'm needing symbols for common fiber optic components, cables, connectors, backbone ports, etc.

Key Takeaways

You can modify fiber optic cables in AutoCAD by using specialized CAD blocks, symbols, and add-ons like ITS-NetDesign™ to adjust cable paths, connectors, and network schematics efficiently.

Using CAD Blocks and Symbols

To modify fiber optic cables in AutoCAD, start by using predefined CAD blocks or DWG files that represent fiber optic components such as cables, connectors, splices, and backbone ports. If standard symbols are not available, you can create custom symbols using the Symbol Editor, which allows you to design boxes, lines, or bowtie splices to represent cable splits and connections. Ensure that all symbols are consistent with your project's labeling and line-type conventions.

Editing Cable Paths

Select the cable line in your AutoCAD drawing. Use grip points or the Move/Stretch commands to adjust the path between nodes, manholes, or building entrances. For complex networks, consider using layer management to separate different cable types or fiber counts, which helps maintain clarity in large designs.

Using Specialized Add-ons

Software like ITS-NetDesign™ integrates with AutoCAD (Map3D) to provide high-level and installer-ready FTTH/FTTX network designs. With this add-on, you can: Automatically generate cable schematics and duct layouts. Update labeling, BoQ (Bill of Quantities), and BoM (Bill of Materials) when modifying cable routes.

Reuse existing data and ensure accurate network design with correct symbols and text. Visualize the network over a top-view map including streets and buildings.

Best Practices

Maintain precision: Fiber optic cables are expensive and require careful planning; always verify measurements and routing. Use layers and color coding: Different fiber types or capacities can be distinguished visually. Document changes: Update all associated labels, splice points, and connector information whenever a cable path is modified.

Leverage automation: If available, use ITS-NetOptimus™ algorithms to optimize cable routing and reduce engineering time. By combining CAD blocks, custom symbols, and specialized AutoCAD add-ons, you can efficiently modify fiber optic cable layouts while maintaining accuracy and clarity in your network design.
