Low-voltage busbar trunking wiring

Overview

Layout 1 The object for this guide is to provide an easily understood document, aiding interpretation of the requirements to which Busbar Trunking Systems.

Key Takeaways

Low-voltage busbar trunking systems (BTS) are prefabricated, modular power distribution assemblies designed for efficient, flexible, and safe electrical distribution in commercial, industrial, and utility applications. Overview and ApplicationsLow-voltage busbar trunking systems are modular assemblies that replace conventional cable risers and distribution cabling, providing a compact and extendable solution for power distribution. They are commonly used in: Office buildings and apartment blocks for rising mains and floor distributionFactories, data centers, airports, and hospitals for high-current distributionInterconnection between switchboards, transformers, and sub-distribution systems Busbar trunking can be installed vertically, horizontally, or in combination, and power is drawn via tap-off units at defined positions along the trunking, typically protected by overcurrent devices.

Types and Construction

Busbar trunking systems are available in two main types: Sandwich (enclosed) type: Compact footprint, high current density, better electromagnetic performance, ideal for crowded ceilings, risers, and data centers Air-insulated type: Easier visual inspection, lower cost, simpler maintenance, suitable for less congested installations Conductors are usually aluminum or copper, with current ratings ranging from 25 A for lighting trunking up to 6300 A for high-current feeders. Systems are engineered to meet short-circuit withstand ratings coordinated with upstream protection devices like MCCBs or ACBs.

Advantages Over Conventional Cabling

Reduced installation time and fewer fixings per meter compared to multiple cable runsFlexibility: Tap-off units can be repositioned or added to accommodate changing power requirementsExtendable system: Easy to expand for future load increasesEngineered and verified: Compliant with BS EN 61439-6 / IEC 61439-6 standards, ensuring safety and performance Cost savings: Less material and labor compared to traditional cable trays and multiple cable runsPlanning and Digital ToolsModern busbar systems, such as Siemens SIVACON 8PS, integrate with digital planning tools like SIMARIS, allowing: BIM-based digital twins for design and installationEnergy data integration with automation and IoT systemsFlexible tap-off placement and project-specific configuration Supply ConsiderationsWhen sourcing low-voltage busbar trunking systems: Verify current rating, short-circuit withstand, and IP rating for your applicationChoose the appropriate construction type (sandwich vs air-insulated) based on space, maintenance, and costEnsure compliance with IEC/BS EN standards for safety and performanceConsider manufacturer support and planning tools for installation, testing, and future expansion Busbar trunking systems are widely available from major manufacturers and distributors, offering a range of modular components including straight lengths, elbows, tees, reducers, end feeds, tap-off boxes, and expansion sections, allowing tailored solutions for any low-voltage power distribution project.
