Manufacturer s High-Speed Optical Connection LPO

Overview

Gemtek OMDN-107 800G LPO transceiver offers high-speed optical connectivity for modern AI and cloud data centers.

Key Takeaways

Linear Pluggable Optics (LPO) are high-speed, low-latency optical modules designed for power-efficient, short-reach data center interconnects.

Overview of LP

O TechnologyLPO, or Linear Pluggable Optics, is a next-generation optical interconnect solution that removes the traditional Digital Signal Processor (DSP) from the module, relying instead on analog linear drivers and transimpedance amplifiers (TIAs) for signal transmission and reception. This architecture allows the module to maintain a pluggable form factor while significantly reducing power consumption, cost, and latency compared to conventional DSP-based optical modules.

Key Features

High Bandwidth: LPO modules support speeds starting at 100 Gb/s per lane, with advanced modules like Amphenol's XPO-LPO delivering 224 Gb/s per lane and 12. 8T Ethernet connectivity. Low Latency: By eliminating DSP processing, LPO reduces end-to-end latency, which is critical for AI, high-performance computing (HPC), and hyperscale data centers.

Power Efficiency: Removing DSPs cuts module power consumption by 30–50%, with typical 800G LPO modules consuming around 8W, compared to 13W for traditional DSP-based modules. Cost Reduction: DSP chips account for 20–40% of module BOM cost; LPO eliminates this expense while slightly increasing driver and TIA complexity, resulting in net savings. Pluggability and Flexibility: LPO modules retain hot-swappability and compatibility with existing MPO optical interfaces, supporting multi-vendor ecosystems.

Short-

Reach Optimization: LPO is optimized for intra-data-center links, typically under 500 meters, where advanced DSP-based signal recovery is unnecessary.

How LPO Works

In LP

O architecture: Transmitter: A high-linearity driver chip directly drives the optical modulator, converting electrical signals into optical signals. Receiver: A high-linearity TIA converts optical signals back to electrical form. Host Processing: Signal equalization and compensation are handled by the host ASIC or xPU, shifting the analog signal processing workload from the module to the host.

This design reduces power, latency, and cost, while placing higher demands on the host's analog front-end capabilities. Comparison with Other Optical InterconnectsCPO (Co-Packaged Optics): Integrates the optical engine directly with the switch ASIC, reducing electrical path length and system power, but requires custom packaging and is less flexible for field upgrades.

NP

O (Near-Package Optics): Places the optical engine near the xPU on the same PCB, improving signal integrity and bandwidth, but still involves more complex integration than LPO.

LP

O Advantages: Maintains pluggable form factor, reduces power and latency, lowers cost, and supports hot-swapping, making it ideal for short-reach, high-density data center deployments. ApplicationsLPO modules are widely used in: Hyperscale data centers requiring high port density and low power per module. AI/ML clusters where low latency is critical for model training and inference.

High-performance computing (HPC) environments demanding ultra-fast, energy-efficient interconnects. Next-generation Ethernet networks (400G/800G) with MPO optical interfaces.

Conclusion

Linear Pluggable Optics (LPO) represent a transformative approach to high-speed optical connectivity, combining pluggability, low power, low latency, and cost efficiency. By offloading signal processing to the host ASIC and eliminating DSPs, LPO modules are particularly suited for short-reach, high-bandwidth, and energy-sensitive data center applications, providing a practical and scalable solution for modern networking demands.
