Optical Module CPO Switch

Overview

Next-Gen Optical Modules: A Technical Comparison of Compare CPO, NPO, and XPO optical modules for 800G/1.6T data centers. Evaluate power efficiency, integr.

Key Takeaways

A CPO switch optical module integrates optical components directly with a switch ASIC, dramatically improving bandwidth, reducing power consumption, and minimizing latency. What is a CPO Optical Module?

A CP

O (Co-Packaged Optics) optical module is a technology where optical components—such as lasers, modulators, photodetectors, and transimpedance amplifiers—are integrated directly with the switch ASIC on the same substrate or interposer. Unlike traditional pluggable optical transceivers, which connect to switches via long high-speed electrical channels, CPO modules shorten the electrical path from centimeters to millimeters, significantly improving signal integrity and reducing insertion loss.

How It Works

In a CPO switch, the optical module and the switch ASIC are co-located, often using silicon photonics (SiPh) and advanced packaging techniques like 2. 5D or 3D integration. The optical engine can be placed on a silicon interposer or an organic substrate alongside the ASIC, enabling millimeter-level electrical connections.

This integration reduces the need for long PCB traces and external connectors, which are common sources of power loss and signal degradation in traditional architectures.

Benefits

Power Efficiency: Shorter electrical paths reduce energy loss, cutting power consumption by up to 50% compared to conventional pluggable optics. Higher Bandwidth: Direct integration with the ASIC allows for higher data rates, supporting 400G, 800G, and even 1. 6T Ethernet or InfiniBand links.

Lower Latency: Reduced signal travel distance improves latency, which is critical for AI workloads and high-performance computing. Scalability: CPO modules enable higher port density and more efficient use of front-panel space, allowing data centers to scale bandwidth without increasing physical footprint. Improved Signal Integrity: Millimeter-level connections reduce the risk of signal degradation, enhancing reliability and performance.

Challenges

Thermal Management: Co-locating high-power electronic and optical components generates heat, requiring advanced cooling solutions. Manufacturing Complexity: Integrating photonics and electronics at the chip level is more complex than traditional pluggable modules. Serviceability: Unlike hot-swappable pluggable optics, CPO modules are tightly integrated, making replacement or upgrades more challenging.

ApplicationsCPO optical modules are increasingly adopted in data centers, cloud infrastructure, and HPC environments, particularly where AI and machine learning workloads demand high bandwidth and low latency. Companies like NVIDIA are deploying CPO switches with silicon photonics to achieve higher power efficiency and network resiliency for large-scale GPU clusters. In summary, CPO switch optical modules represent a next-generation approach to data center networking, combining optical and electronic components in a single package to deliver superior performance, efficiency, and scalability compared to traditional pluggable optical transceivers.

Next-Gen Optical Modules: A Technical Comparison of

Compare CPO, NPO, and XPO optical modules for 800G/1.6T data centers. Evaluate power efficiency, integration, and OCS synergy for your

Co-Packaged Optics (CPO) 2026: Complete Technical

CPO switches are shipping in 2026. Learn how co-packaged optics work, which platforms are live, power savings vs pluggable, and what optics you

Co-Packaged Optics — a deep dive | APNIC Blog

© 2026 CJC FIBRE CONSULTANTS - All rights reserved

A failure in an optical engine might require replacing an entire CPO switch line card or server board rather than just swapping a pluggable module. Developing robust testing, diagnostics,

CPO Switch: Next-Generation Integrated Optical Networking ...

CPO switches shorten the electrical signal path, reduce power consumption, and decrease the number of pluggable modules by co-packaging optical modules with switch chips, while

What is Co-Packaged Optics (CPO) Technology?

Today, data centers use a separate approach for optics and electronics, in which optical modules are connected to switches and routers through high-speed

Optics Primer, Part 3: Co-Packaged Optics (CPO)

NPO Near package optics (NPO) brings the optics module on the same substrate or very close to the switch package, but not inside it: It''s close enough to reduce most copper impairments.

Broadcom CPO: Highest Power Efficiency and Bandwidth Density

Broadcom''s co-packaged optics (CPO) technology is based on highly integrated Silicon Photonics and is purpose built to address the demanding needs of AI networks by providing the

Co-Packaged Optics (CPOs)

Instead of purchasing interchangeable pluggable modules from multiple vendors, customers have to source integrated CPO switches or servers from a single system vendor or a

Silicon Photonics Networking for Agentic AI | NVIDIA

Revolutionizing Networking for the Era of Agentic AI NVIDIA''s co-packaged optics (CPO) switches with integrated silicon photonics are the world''s most advanced

The Rise of Co-Packaged Optics: A Deep Dive into CPO Optical

Enter Co-Packaged Optics (CPO), a transformative architecture where the optical engine moves inside the switch ASIC package. This article provides a comprehensive overview of CPO

The Rise of Co-Packaged Optics (CPO) and Silicon Photonics in

As generative AI models scale, traditional pluggable optical transceivers face a power-performance wall. Co-packaged Optics (CPO) and Silicon Photonics address this by integrating
