Parallel cable tray spacing

Overview

When installing two cable trays in parallel at the same height, the distance between them should be no less than 0.6 meters.

Key Takeaways

Parallel cable trays should generally be spaced at least 0. 6 meters apart to ensure maintenance access, proper airflow, and safety.

Horizontal Spacing Between Parallel Trays

When installing two cable trays in parallel at the same height, the minimum recommended distance is 0. 6 meters (approximately 2 feet). This spacing allows: Adequate maintenance and inspection access for technicians.

Proper airflow for heat dissipation, reducing the risk of overheating. Prevention of cables touching, which could cause short circuits or interference. For power and signal cable trays, a horizontal separation of at least 0.

5 meters is recommended to minimize electromagnetic interference (EMI). If the trays are shielded, this distance can be reduced to 0. 3 meters because shielding contains EMI within the tray.

Vertical Spacing Considerations

For floor-mounted or stacked trays, a minimum vertical clearance of 150 millimeters (6 inches) is advised. This ensures: Structural integrity of the system. Space for future installation of additional trays or cables.

Adequate ventilation and cooling.

Support and Load Considerations

Cable tray supports must be designed to handle the mechanical load of the cables and the tray itself. Support elements, such as wall brackets, suspended supports, or center suspensions, should comply with standards like DIN EN 61537 and be installed according to manufacturer specifications. Proper support spacing also prevents sagging and maintains the tray alignment.

Compliance and Safety

Follow NE

C Article 392 for industrial installations, which emphasizes clearances, separation of high- and low-power cables, and accessibility. Ensure that trays are not installed in prohibited areas such as hoistways or enclosed spaces. Metallic trays can serve as grounding conductors if installed according to NEC requirements.

Summary Recommendations

Parallel tray spacing: ≥ 0. 6 meters. Power vs signal tray spacing: ≥ 0.

5 meters (≥ 0. 3 meters if shielded). Vertical clearance: ≥ 150 mm.

Support spacing: per manufacturer and load requirements, ensuring structural integrity. Maintaining these spacing requirements ensures safe, efficient, and code-compliant cable tray installations, while facilitating maintenance and minimizing interference.
