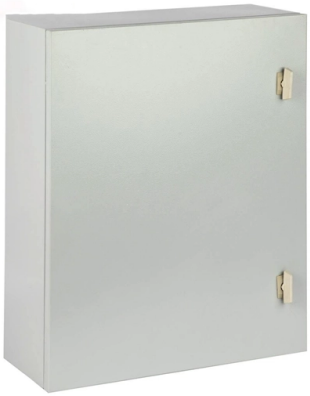
Relay Protection Type Code



Overview

In the design of electrical power systems, the ANSI Standard Device Numbers denote what features a protective device supports (such as a relay or circuit breaker).

Key Takeaways

Relay protection codes are standardized ANSI/IEEE device numbers used to identify protective relays and their specific functions in electrical power systems. Overview of ANSI/IEEE Device NumbersANSI/IEEE device numbers are defined in ANSI/IEEE Standard C37. 2 and are widely used in North America to identify protective relays, circuit breakers, and other control devices in power systems.

Each number corresponds to a specific protective function. Historically, each device performed a single function, but modern microprocessor-based relays can perform multiple functions, often indicated by combined device numbers.

Common Device Numbers

Some of the most frequently used relay protection codes include: 50 – Instantaneous Overcurrent Relay51 – Time Overcurrent Relay27 – Undervoltage Relay59 – Overvoltage Relay87T – Transformer Differential Relay87G – Generator Differential Relay86T – Lockout Relay for Transformer50N / 51N – Neutral Overcurrent RelaysSuffixes and LettersLetters or numbers can be added to device numbers to indicate specific applications or conditions: G – Ground (e.g., 51G for time overcurrent ground relay) or Generator (e.g., 87G for generator differential)T – Transformer (e.g., 87T for transformer differential)N – Neutral (e.g., 59N for neutral overvoltage)F – Field or Fuse (e.g., protective fuse for a pickup transformer) These suffixes help clarify the exact function or location of the relay in the system.

Multifunction Relays

Modern relays often combine multiple functions into a single device. For example: 27/59 – Combined undervoltage and overvoltage relay50/51 – Instantaneous and time overcurrent relay In documentation such as single-line diagrams, these codes indicate which protective functions are implemented, making it easier for engineers to understand system protection schemes.

Practical Use

Relay protection codes are essential for: Designing and documenting protection schemesCoordinating relays for selective trippingTroubleshooting faults and system eventsEnsuring compliance with industry standards By using ANSI/IEEE device numbers, engineers can communicate relay functions clearly across different systems and manufacturers, even in regions where IEC standards are also used. In summary, relay protection codes provide a standardized method to identify and document the protective functions of relays, ensuring reliable and coordinated operation of electrical power systems.

ANSI (IEEE) Protective Device Numbering

Protective relays are commonly referred to by standard device numbers. For example, a time overcurrent relay is designated a 51 device, while an instantaneous overcurrent is a 50 device.
