Relay protection recording time

Overview

• recording period (5-60 sec) • pre-trigger (0-100%) • trigger event (start for recorder) • trigger event (stop for recorder) The recording period depends on the number of samples. The relay is connected to the circuit to be protected via CTs and VTs according to the required protection function. In order for the relay to operate, it needs to be energized. This energy can be provided by battery sets (mostly) or by the monitored circuit itself. This data is crucial for diagnosing issues, understanding system behavior, and designing better control strategies. The concept extends beyond mere logging; analysis of these recordings reveals patterns and. Event log The Event Log (also referred to as the Operational Indication Buffer) operates continuously and records status changes of all the information items that are set to be monitored. Up to 200 Events can be stored in the cyclic buffer, when then the. Protective relays and devices have been developed over 100 years ago to provide “last line” of defense for the electrical systems.
