

Relay protection test passed

Overview

A comprehensive testing program should simulate fault and normal operating conditions of the relay. Acceptance testing, commissioning, and startup will include control power tests, current transformer and potential transformer tests, and any other device testing. The testing and verification of relay protection devices can be divided into four groups: Type tests are needed to prove that a protection relay meets the claimed specification and follows all relevant standards. If you've been in protection testing for a while, you'll know the job has changed – not always for the better. This is why protection relays must undergo thorough tests throughout their entire lifecycle – from development and manufacturing to commissioning and regular maintenance. Modern networks rely on and utilize relay protection systems in order to maintain a safe electrical environment by continuously monitoring devices for problems and controlling the grid to isolate problematic areas.
