Southern European hot-dip galvanized cable tray specifications

Overview

An added advantage of hot-dip galvanizing is that along the edges and pointy bits, where objects are usually extra susceptible to corrosion, the zinc coating is thicker because of the behaviour of the liquid.

Key Takeaways

Hot-dip galvanized cable trays in Southern Europe are typically made of carbon steel with a minimum zinc coating of 60 µm according to NEN-EN-ISO 1461, designed for heavy-duty and outdoor applications. Material and CoatingHot-dip galvanized (HDG) cable trays are generally manufactured from carbon steel and coated with zinc through immersion in a molten zinc bath, following the NEN-EN-ISO 1461 standard. This ensures a minimum zinc layer thickness of 60 µm, providing long-term corrosion protection suitable for harsh outdoor and industrial environments.

The zinc coating acts as a sacrificial anode, protecting the steel even if the surface is scratched. Some trays may also be available in stainless steel 304 or 316 for enhanced corrosion resistance in chemical or maritime conditions.

Dimensions and Design

Typical Southern European HD

© 2026 CJC FIBRE CONSULTANTS - All rights reserved

G cable trays have the following dimensions: Height (H): 100–100 mm (common sizes include 40, 50, 60, 100 mm)Width (W): 300 mm or larger depending on seriesLength (L): Standard 3 metersThickness (E): 1. 0 mm or higher for heavy-duty applicationsPerforation: Perforated trays allow ventilation, prevent cable overheating, and facilitate drainage, while non-perforated trays are used for large-diameter cables or aesthetic applications. Load Capacity and Structural FeaturesHDG cable trays are designed for high carrying capacity, suitable for power plants, industrial facilities, and outdoor infrastructure projects.

The perforated design improves air circulation and heat dissipation, while the robust steel structure ensures mechanical strength and durability. Connection parts typically use M6x12 mm bolts, and product weights may vary ±10% depending on size and series.

Environmental Suitability

These trays are suitable for heavy industrial, outdoor, and chemically challenging environments. The hot-dip galvanization provides long-lasting corrosion resistance, making them ideal for Southern European climates where exposure to moisture, salt, and temperature variations is common. For indoor or light industrial use, pre-galvanized steel (EN 10346) may be sufficient, but HDG is preferred for outdoor and high-corrosion conditions.

Compliance and StandardsNEN-EN-ISO 1461: Specifies hot-dip galvanization requirements, including minimum zinc thickness and corrosion protectionCE marking: Indicates compliance with European directives for safety and qualityOptional certifications: Some manufacturers provide additional third-party certifications for mechanical and electrical performance.

Summary

Southern European hot-dip galvanized cable trays are robust, corrosion-resistant, and suitable for heavy-duty applications, with standard lengths of 3 meters, perforated or non-perforated designs, and zinc coatings of at least 60 µm. They are widely used in industrial, outdoor, and infrastructure projects, providing reliable cable management and long-term durability.
