Standard for Ladder-Type Steel Cable Trays

Overview

Ladder cable tray is available in widths of 6, 9, 12, 18, 24, 30, 36, 42 and 48 inches with rung spacings of 6, 9, 12 or 18 inches.

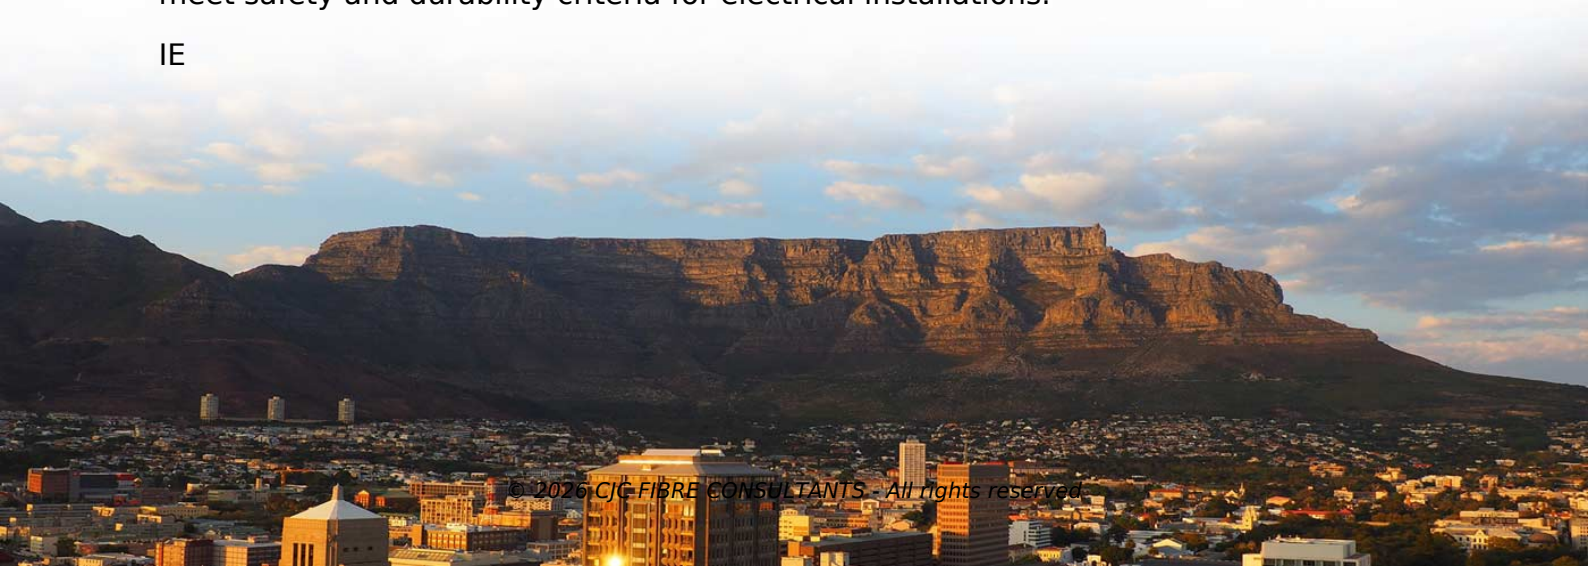

Key Takeaways

Ladder-type steel cable trays are primarily governed by NEMA VE 1, UL 568, IEC 61537, and NFPA 70/NEC standards, which cover design, construction, testing, and installation requirements. Key StandardsNEMA VE 1 This standard specifies the manufacturing requirements for metal cable trays, including ladder-type trays, channel trays, single-rail trays, wire mesh trays, and solid-bottom trays. It defines load/span class designations, material specifications, and associated fittings for compliance with the National Electrical Code (NEC) in the United States, ensuring structural integrity and safe cable support.

U

L 568 Underwriters Laboratories standard UL 568 covers performance requirements for fiberglass and metal cable trays, including ladder-type trays. It ensures that trays meet safety and durability criteria for electrical installations.

C 61537: 2023 The International Electrotechnical Commission standard IEC 61537 specifies requirements and tests for cable tray and ladder systems used to support and accommodate cables and other electrical equipment. It includes provisions for grouping cables, mechanical strength, and the use of trays as protective earth conductors. This standard is widely recognized internationally and provides a technical framework for both metallic and nonmetallic trays.

NFP

A 70 / NEC The National Electrical Code (NEC) provides installation requirements for cable tray systems, including ladder-type trays. Article 310 addresses ampacities of conductors, while other sections cover proper installation, spacing, and support to ensure electrical safety. Canadian Electrical Code (CEC C22.

1-Part 1) For installations in Canada, the CEC specifies installation, ampacity, and conductor requirements for cable trays, including ladder-type steel trays, ensuring compliance with national safety standards.

Additional Considerations

Material and Surface Treatment: Steel ladder trays may be galvanized, painted, or coated for corrosion resistance. Standards often specify acceptable treatments and mechanical properties. Fittings and Accessories: Horizontal and vertical fittings, splices, covers, and supports must comply with the same standards to maintain structural integrity and safety.

Testing and Certification: Compliance with UL, NEMA, or IEC standards often requires third-party testing and certification to verify load capacity, fire resistance, and electrical safety. Installation Guidelines: Proper handling, storage, and installation practices are outlined in NEMA VE 1 and NEC to prevent mechanical damage and ensure long-term performance. In summary, ladder-type steel cable trays must meet NEMA VE 1 for manufacturing, UL 568 for performance, IEC 61537 for international compliance, and NEC/NFPA 70 for installation safety, with additional guidance from CEC in Canada.

These standards collectively ensure that cable trays are structurally sound, electrically safe, and suitable for supporting power and control cables in industrial and commercial installations.
