Trench bottom during direct burial optical cable laying

Overview

The trench bottom should be raked free of all debris prior to cable placement. 1 OFS optical fiber cables are designed to meet the rigors of conventional aerial, direct buried, and underground duct environments. Corning Optical Communications recommends that fiber recommended de cm). The table provides suggested cover depths. Refer pose the cable to erosion or. Even on a mostly direct-bury route, use short sections of rigid conduit or handholes at road crossings, intersections and building entrances to protect against concentrated loads and to enable easier future access. Two common methods are manual/mechanized trenching and plowing: Trenching is used. Direct burial fiber optic installation eliminates conduit cost but demands the right cable construction, proper bedding, and precise depth to meet NEC and Telcordia GR-20 requirements.
