UPS power system self-test

Overview

A new unit with self-test capability will automatically run a self-test on start-up and then run periodic tests on a set schedule, often every 14 days by default. During the test, the UPS will place the load onto battery power to test the strength of the battery. This can be adjusted via PowerChute, the LCD Screen, or the Network Management Card. Click Run New Test to initiate a self test diagnostic. Regular testing prevents unexpected failures and data loss. Don't wait. The replace battery indicator (Red LED) is designed as a early warning signal to the Smart-UPS user. If the LED is illuminated, that does not necessarily mean that the UPS is incapable of supporting the load. A UPS varies from an auxiliary, emergency, or standby power system (or) standby generator. This video demonstrates how to perform a self-test on a SmartOnline® UPS system.
