Voice-controlled light sensor module

Overview

Build a Voice-Controlled Lamp | Science ProjectPlanning Your Voice Control SystemChoosing A Speech Recognition ModuleUsing The Elechouse Voice Recognition.

Key Takeaways

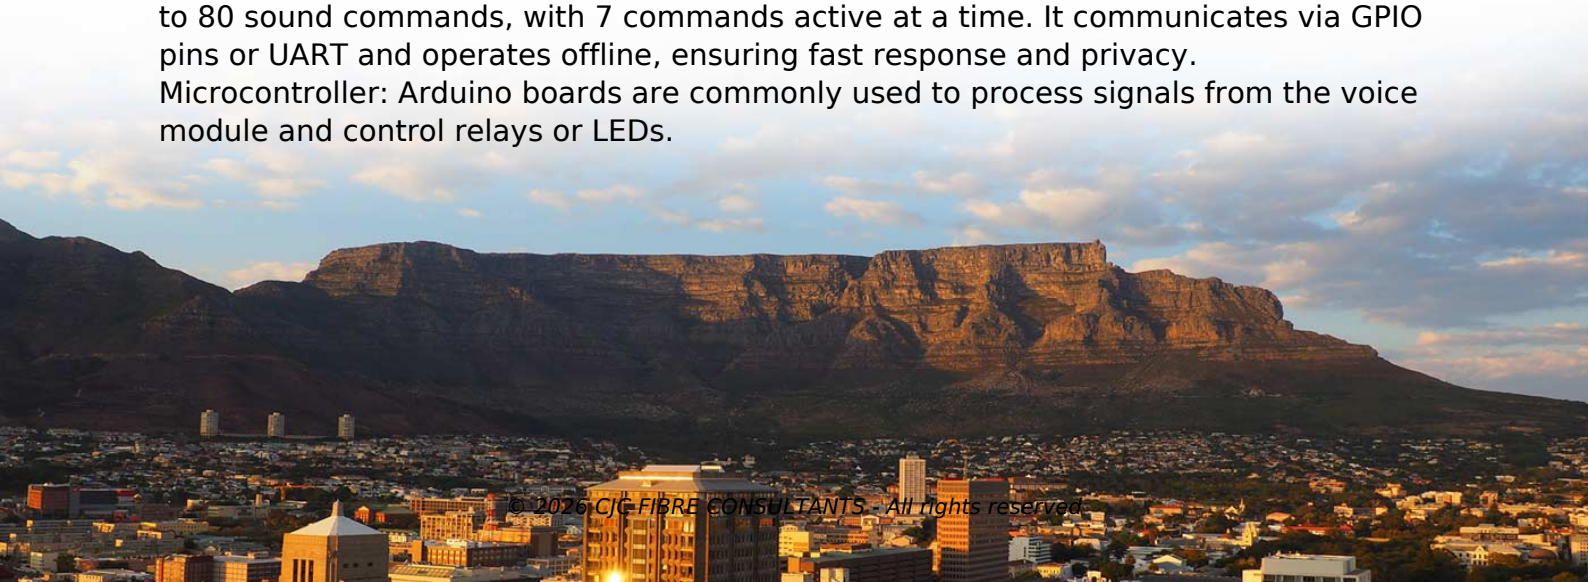

A voice-controlled light sensor module allows you to operate lights using voice commands, often integrated with Arduino and relay modules for safe control of high-voltage devices.

Overview

A voice-controlled light system typically combines a voice recognition module, a microcontroller (like Arduino Uno, Nano, or Mega), and optionally a relay module to safely switch high-power lights. The voice module detects specific commands and sends signals to the microcontroller, which then activates the relay to turn lights on or off.

Key Components

Voice Recognition Module: Modules like the Voice Recognition Module V3 can store up to 80 sound commands, with 7 commands active at a time. It communicates via GPIO pins or UART and operates offline, ensuring fast response and privacy.
Microcontroller: Arduino boards are commonly used to process signals from the voice module and control relays or LEDs.

Relay Module: Relays allow the Arduino to safely control high-voltage devices. Typical modules have 8 channels, each capable of handling up to 250V/10A, with optocoupler isolation and LED indicators for status. Sensors (Optional): Light sensors can be added to automate switching based on ambient light, combining voice control with environmental sensing.

How It Works

Voice Command Detection: The module continuously listens for trained commands like “Light On” or “Light Off”. Signal Transmission: When a command is recognized, the module sends a signal to the Arduino via GPIO or UART. Relay Activation: The Arduino triggers the relay, which switches the connected light or appliance safely.

Optional Automation: Light sensors can provide additional control, e.g., preventing lights from turning on during daylight.

Implementation Tips

Power Supply: Voice modules typically run on 4. 5–5. 5V and draw ~40mA; relays require 5V for the coil.

Programming: Use Arduino libraries for voice modules and relay control. Avoid using delay() in code to maintain responsiveness while switching relays. Safety: Always enclose high-voltage connections in a protective case and verify wiring before powering the system.

Command Chaining: You can chain commands to expand functionality, e.g., “Jarvis → Lights → On,” allowing hundreds of unique sequences.

Applications

Smart home lighting systemsHands-free control for accessibilityIntegration with IoT devices for automationCombining voice commands with environmental sensors for energy efficiency By combining a voice recognition module, Arduino, and relay-controlled lights, you can create a flexible, offline, and responsive voice-controlled lighting system suitable for both hobbyist and practical home automation projects.

Build a Voice-Controlled Lamp | Science Project

Planning Your Voice Control SystemChoosing A Speech Recognition ModuleUsing The Elechouse Voice Recognition Module V3Using The Grove Speech RecognizerUsing The IoT RelayBuild Your Smart Home DeviceUsing the information in the sections above, you should now be ready to set up your own voice-controlled smart home appliance. 1. Set up your voice recognition module. You can follow the instructions in one of the sections above, or follow the instructions that came with your module if you purchased a different one. 2. Test your voice commands and ...See more on sciencebuddies Github

GitHub - KerbyGit/Voice-Light-Arduino

This project aims to allow the users to control their lighting system via voice control, thus allowing for a hands-free system. We can remotely control a red LED as well as a small lightbulb with just the

Using the Voice Recognition Module V3 with Arduino

In this article you will learn how to use the speech recognition module V3 to control a light with your voice.

Voice-Controlled Home Light System – Robocraze

Learn how to build a voice-controlled home light system for smart home automation using simple electronics and voice commands.

Control lights by voice commands and keys

In this tutorial we will see how to create a device to control lights by voice commands, with a module from geeetech.

ESP32-Powered Voice-Controlled LED Lighting System

Explore comprehensive documentation for the ESP32-Powered Voice-Controlled LED Lighting System project, including components, wiring, and code. This project features a voice-controlled lighting

Smart Home STEM Project: Voice Controlled Lights Arduino

Build a voice controlled lights system with Arduino and HC-05 Bluetooth. Step-by-step STEM project guide with code, circuit diagrams, and competition tips.

Hiwonder LeArm AI Desktop Robot Arm with AI Vision

Support Sensor Expansion The Advanced Kit includes sensor modules, enabling creative functions such as AI vision interaction, AI voice control, and multi-sensor
