What is the structural principle of silicon photonics modules

Overview

The basic technology makes use of Silicon-on-Insulator (SOI) wafers, where the silicon layer on top of a buried silicon oxide layer on a silicon wafer acts as the core of the waveguides that interconnect the devices on the chip. Silicon photonics is the study and application of photonic systems which use silicon as an optical medium. The silicon is usually patterned with sub-micrometre precision, into microphotonic components. Thereby it opens a route towards very advanced PICs with very high yield and low cost. More simply, while traditional semiconductors like CPUs, GPUs, and SoCs in computers and smartphones are silicon-based integrated circuits, silicon. Before introducing silicon photonics, let's first look at a traditional optical communication infrastructure model: This model should be relatively easy to understand.
