

What kind of cables are used in fiber optic patch panels

Overview

In this guide, we categorize them into fiber patch cable types and specialty fiber cable types to help you better understand the differences and choose accordingly.

Key Takeaways

Fiber optic patch panels are connected using fiber optic patch cables (jumpers) with appropriate connectors, typically LC, SC, or MPO, depending on the equipment and network design.

Types of Cables

Fiber optic patch cables are short, flexible cables with connectors on both ends, designed to link devices such as switches, servers, transceivers, and patch panels. The main types are: Single-mode (SM, OS1/OS2): Narrow core ($\sim 9\mu\text{m}$) for long-distance transmission, ideal for telecom, campus networks, or backbone connections. Multimode (MM, OM1/OM2/OM3/OM4/OM5): Wider core (50-62.

5 μm) for short-distance, high-speed links within data centers or office environments.

Connector Types

The connectors on patch cables must match the patch panel ports: LC (Lucent Connector): Small form factor, duplex, commonly used in modern data centers and QSFP transceivers.

S

C (Subscriber Connector): Larger, easy to handle, often used in FTTH or CATV applications. MPO/MTP: Multi-fiber connectors for high-density applications, often used in backbone or cross-connect panels.

Cable Configuration

Simplex: Single fiber, one-way transmission, used for one-directional links. Duplex: Two fibers, two-way transmission (Tx/Rx), standard for Ethernet and PON links. MPO/MTP Trunk: Multi-fiber backbone cables connecting multiple ports simultaneously, often terminated at patch panels for high-density setups.

Jacket Types

Choose the jacket material based on installation environment: PVC: Basic indoor use, not suitable for air ducts. Plenum (OFNP): Fire-resistant, safe for air ducts. Riser (OFNR): For vertical shafts between floors.

LSZ

H (Low Smoke Zero Halogen): Emits minimal smoke/toxic gas, common in Europe and high-safety areas. Typical Connections Intra-rack: Server NIC to top-of-rack switch via LC duplex or MPO breakout. Inter-rack: Horizontal patching between row distribution frames and spine switches.

Cross-connect frames: Structured patching in main distribution areas (MDA) or IDF/MDF. FTTH/building entry: Indoor-outdoor transition cables connecting outside plant to customer premise equipment.

Best Practices

Match fiber mode (single-mode or multimode) to the distance and network requirements. Ensure connector type aligns with both patch panel and device ports. Use duplex cables for bidirectional links and MPO/MTP for high-density connections.

Select jacket type according to fire codes and environmental conditions. Avoid mixing single-mode and multimode fibers to prevent signal loss. By using the correct fiber optic patch cables with compatible connectors and proper jacket types, your patch panel will provide reliable, high-speed connectivity across your network infrastructure.
