

Wiring of Suriname power distribution box

Overview

New construction can use half bricks or cut bricks to the size needed, mortar in the box, and wire along with the bricks.

Key Takeaways

In Suriname, power distribution boxes are wired for 110V, 60Hz systems using American-style plugs (Type A & B), with protective devices like MCBs and RCCBs installed according to load requirements.

Voltage and Plug Standards

Suriname uses a 110-volt, 60 Hz AC supply, similar to the United States, with Type A (ungrounded) and Type B (grounded) plugs for domestic outlets. Type B plugs include a grounding pin, while Type A plugs are polarized but ungrounded. Both plug types are rated at 15 A, and outlets are not recessed, which requires careful handling to avoid accidental contact with live pins.

Domestic Distribution Box Wiring

For residential or small commercial installations, single-phase distribution boxes are common. These typically include: Main MCB (Double Pole): Acts as the main switch, rated according to the total load (commonly 63A for domestic use) and connects the incoming phase and neutral.

Single-Pole MC

Bs: Protect individual circuits such as lighting, outlets, or small appliances.

RCC

B (Residual Current Circuit Breaker): Provides protection against leakage currents, insulation faults, and electric shocks. Its rating should match the main MCB. The wiring sequence generally connects the incoming supply to the main MCB, then distributes power to downstream MCBs and RCCBs, which feed individual circuits.

Special loads may require double-pole MCBs for additional protection.

Industrial Distribution Boxes

In industrial settings, such as beverage bottling plants in Suriname, custom low-voltage distribution panels are used to manage complex loads. Key features include: Centralized main switch panel with step-down transformers. Main distribution panel feeding multiple sub-distribution panels for different areas or machinery.

Dedicated UP

S circuits for critical control systems. Tiered architecture to isolate faults and allow scalable expansion. Load-specific protection for motors, lighting, and utility systems.

This approach ensures operational continuity, safety, and easier maintenance in high-demand industrial environments.

Safety Considerations

Ensure proper grounding for all Type B circuits.

Use RCC

Bs to prevent electric shock, especially in wet or high-risk areas. Avoid partially inserted plugs, as Suriname's outlets are not recessed and can expose live pins. Follow local electrical codes and standards for wire sizing, breaker ratings, and panel installation.

Local Suppliers and Equipment

Suriname has verified suppliers for electrical goods, including distribution panels, MCBs, RCCBs, and surge protection devices. For industrial projects, custom panel builders can design systems tailored to operational needs, while residential installations can use standard single-phase distribution boxes. By adhering to these standards and using appropriate protective devices, wiring in Suriname's power distribution boxes can be both safe and reliable for domestic and industrial applications.
